AOV Up 11.52% in a Month. *Without Leaning on Item Discounts.*

A wellness and supplements brand lifted TikTok Shop AOV from \$35.93 to \$40.07 month over month — built on bundles and cart-building promotions, not blanket price cuts.

JULY AOV, UP FROM \$35.93

\$4.14

ADDED TO EVERY ORDER

01 Setup

A wellness and supplements brand was running a healthy TikTok Shop. Orders were coming in. The constraint was not traffic — it was basket size. June closed at an average order value of \$35.93, and the growth plan needed that number to move.

02 Problem

There is an easy way to move AOV and a durable one. The easy way is to discount harder and hope volume covers the gap — which lifts units, crushes margin, and teaches the audience to wait for the next price cut. On TikTok Shop, where discount mechanics are everywhere and buyers are already conditioned to them, that is the default gravity. This brand wanted the durable version: a bigger cart, at the same margin per item, without training its buyers to only ever buy on sale. And the trap is self-reinforcing: every cycle of item-level discounting narrows the window in which full price feels reasonable, so the next month needs a deeper cut to move the same volume.

Operator note — AOV built on item discounts is not AOV growth — it is margin transfer. The headline number goes up and contribution per order does not move.

03 The Bundle AOV Lift

The Bundle AOV Lift moves the promotional weight off the individual SKU and onto the cart. Instead of making one item cheaper, you make buying more items worth it. The offer architecture rewards basket size, so the incentive scales with what the customer adds rather than discounting what they were already going to buy. Item price integrity stays intact — cart value does the work. The mechanic is simple to state and hard to hold: reward the second and third item, never the first. Discipline on that one rule is what separates an AOV lift from a margin giveaway wearing an AOV lift's numbers.

04 The moves

Bundle

We built the assortment around bundles rather than single units. Products that get consumed together, or that a first-time buyer would logically pair, were packaged into one purchase decision instead of two.

Promote

Promotions were reworked to reward cart building. The incentive triggers on what is in the basket, not on the price of any one item — which points the discount at the behavior we want to encourage instead of at revenue the brand would have earned anyway.

Protect

Individual item discounts were minimized. Holding single-SKU price integrity is what makes the AOV lift real margin rather than a reshuffle, and it keeps the brand out of the discount-expectation trap.

05 Result

July AOV came in at \$40.07, up 11.52% month over month from June's \$35.93. That is \$4.14 more on every single order, across the same catalog, without cutting item prices to get it.

JUNE AOV

\$40.07

JULY AOV

+11.52%

MONTH-OVER-MONTH LIFT

\$4.14

ADDED PER ORDER

The percentage matters less than what it proves. A double-digit AOV lift achieved through offer architecture — not price — means the mechanism is repeatable next month and the month after. It also resets what the team believes the platform will give them: a higher AOV is not something TikTok Shop denies you, it is something the offer structure either earns or gives away. On a catalog this brand already owned, with no new SKUs and no new traffic, the entire gain came from how the offer was assembled.

06 Operator takeaway

If your AOV is flat, audit what your promotions are rewarding before you touch your price. Most TikTok Shop discount structures pay customers for purchases they were already going to make. Point the incentive at basket size instead — bundle the things that get bought together, trigger the promo on the cart, and hold the line on single-item price. You are not asking buyers to pay more for the same thing; you are making it obviously better to buy more at once. That is an AOV lift you keep, and it compounds against every other lever you pull on the channel.
