

REACH SOCIAL CASE STUDY

Category: Home and Garden Pest Control

A 22-Day High in the Off-Season. \$824 on a Day We Braced for Triple Digits.

Carpenter bee season ended and everyone expected daily GMV to fall to \$100 to \$300. A shop-wide optimization pass put the number at \$824 on July 29 — the best TikTok Shop day in 22 days.

THE FEARED OFF-SEASON FLOOR

01 Setup

This is a home and garden pest control brand on TikTok Shop, and its category has a calendar. Carpenter bee products sell when carpenter bees are a problem. When the season turns, search volume for the whole category turns with it. Every operator in a seasonal category learns the same lesson eventually: the demand curve is not something you argue with. So the question going into the back half of July was not whether volume would drop. It was how far, and whether anything on the shop side could hold the floor up while the category went quiet.

02 Problem

The honest expectation was \$100 to \$300 a day. That was the number the team and the client were both bracing for, and it was a reasonable number. Off-season traffic in a seasonal category is thin, intent is soft, and the easy answer is to accept it and wait for next spring. That is the trap. A shop that coasts through the off-season carries every unfixed listing, every weak search match, and every dead automated message straight into peak season, when the traffic that would have exposed those gaps is finally showing up.

Operator note — Slow seasons are the cheapest time to fix a shop. Traffic is low, so the cost of testing is low, and every fix compounds into the next peak.

We treated the slump as build time instead of dead time. Rather than chase demand that was not there with paid pressure or discounting, we ran a full optimization pass across the shop itself — the four surfaces that convert whatever traffic does arrive. Listings, in-shop search, creative assets, and automated messages. None of these are demand generation. All of them are conversion infrastructure. The thesis is straightforward: if the shop converts better, a slow day stops looking like a slow day. Treat TikTok Shop as retail, not social, and the off-season becomes the merchandising window it already is in every other retail channel.

Rebuild the listings

A full pass across product listings — the copy, the structure, and the details that decide whether a shopper who lands on the page understands the product fast enough to buy it. Listings are the last surface before checkout and the one most often left alone once a shop is live.

Fix in-shop search

Search inside the shop is where intent already exists. When the category is quiet, the buyers still browsing are the highest-value traffic on the platform. We reworked how products surface against what people actually type, so the small volume that arrived found the right SKU instead of bouncing.

Refresh the assets

Creative assets were rebuilt across the shop. Off-season shoppers are less impulsive and more comparative, which raises the bar on what the imagery and product presentation have to do before a purchase happens.

Automate the messages

Automated messages were reworked so every inbound conversation ran on a current script rather than whatever was written at launch. In a thin-traffic window, recovering a single stalled conversation is a measurable share of the day.

Daily GMV hit \$824 on July 29. That is the best TikTok Shop day the shop had posted in 22 days, and it landed in the stretch of the calendar everyone had already written off. No new demand event, no seasonal tailwind, no discount push. The category was still in its trough. The shop was simply converting better than it had been.

SHOP SURFACES REWORKED

The client's read on it was the same as ours: "Yesterday at \$824 was the best TTS day in 22 days! Great job team." What makes that number useful is not its size. It is where on the calendar it happened. A high posted during peak demand tells you the season is working. A high posted during the trough tells you the shop is working, and that is the more durable signal of the two.

06

Operator takeaway

If your category has a season, you have two shops: the one that rides demand and the one that survives without it. Most brands only ever measure the first. The off-season is the only window where a shop's conversion fundamentals get tested without traffic covering for them, which makes it the most honest reporting period you get all year — and the cheapest one to fix things in. Do the listings, the search, the assets, and the message flows while the stakes are low. The floor you build in the trough is the floor you scale from at peak.
